ERSITY OF MARY

MARYLAND

STATISTICAL ABSTRACT

BOSTON ■

NEW YORK ■

PHILADELPHIA ■

THE COVER

AS THE SOUTHERN ANCHOR OF THE NORTHEASTERN
MEGALOPOLIS REACHING FROM BOSTON TO WASHINGTON, D. C.,
MARYLAND HAS EMERGED AS A DYNAMIC ECONOMIC AREA.

FAVORABLY SITUATED IN THE MIDST OF A VAST CONSUMER
MARKET, RAW MATERIALS AND AN EXTENSIVE AIR, LAND AND
WATER TRANSPORTATION NETWORK, MARYLAND IS IDEALLY
LOCATED FOR MANUFACTURING, RESEARCH AND DEVELOPMENT,
DISTRIBUTION, RECREATION AND TOURISM.

DO NOT CIRCULATE

DEPARTMENT OF ECONOMIC DEVELOPMENT
STATE OFFICE BUILDING
ANNAPOLIS, MARYLAND 21401

October 30, 1967

The Honorable Spiro T. Agnew
Governor of Maryland
The State House
Annapolis, Maryland 21401

Dear Governor Agnew:

It is with great pleasure that we transmit to you this report, "Maryland Statistical Abstract."

This is one in a series of biennial reports which presents a statistical record of the composition, changes and trends in the population, business, agriculture, natural resources and many other aspects of life in Maryland. This report deals in facts and figures, but the ultimate concern is with the well-being of the human resources of the State---Maryland's men, women and children.

It is hoped that these data will be informative and useful to individuals, business firms, and state and local governmental agencies in Maryland and elsewhere, and that they will provide the basic information necessary to sound decisions on many matters vital to the welfare of Maryland's citizens.

This report is part of the Department's over-all program to bring together in this Department the many types of information on Maryland's economic resources necessary for effective long-range planning and to assist residents and potential investors in Maryland's economic opportunities. Supplementing this series of reports are annual reports which discuss and analyze a specific and particular aspect of the Maryland economy as well as monthly reports dealing with Maryland economic indicators.

Every care has been exercised to ensure the usefulness and accuracy of this publication. We welcome suggestions which will improve the utility of future editions and would appreciate having them brought to our attention.

Ralph O. Dulany

PREFACE

The well being of Maryland residents depends, in large measure, upon the value of the State's human and physical resources. In addition to being a function of quality and quantity, the value of resources depends on their effective utilization. This report is designed to provide business and government leaders and other interested people with a comprehensive picture of Maryland's resources in terms of recent development.

The tables presented here are a compilation of available secondary data and are not always consistent due to different sources. Therefore, the statistical picture presented here is less an analysis than a statistical abstract. The primary purpose of this study was to update The Maryland Economy No. 1 - 1962. Modest expansion of the previous report will provide additional information about climate, geography, retail and wholesale sales, and federal property. The brief summary word pictures and bar figures present an overview of the data in the tables.

This report was developed by the Maryland State Economic Development Department with the assistance of the Urban Studies Institute of Morgan State College and Strategic Planning Corporation of Baltimore. Homer E. Favor of Morgan State College and Blair A. Simon of Strategic Planning Corporation were Project Managers. The entire effort was under the direction of Sidney Hatkin of the Maryland State Department of Economic Development.

SUMMARY

MARYLAND - AMERICA IN MINIATURE

The popular slogan describing the State of Maryland as "America in Miniature" is indeed plausible considering the State's geographic, demographic and economic diversification. Maryland ranges from the Atlantic Seaboard on the East to the Appalachian Mountains bordering America's Mid-West. In between these boundaries lies a striking variety of climate and terrain and the huge Chesapeake Bay. The economic structure ranges from the nation's most affluent suburban county to the heavily industrialized area of metropolitan Baltimore; to the Appalachian economy of parts of Western Maryland; and the rural southern character of the Eastern Shore and Southern Maryland. Although there is no standard uniformly acceptable regional designation, the State Planning Department has divided Maryland into the following major sections:

1. All of Metropolitan Baltimore:	Baltimore City Anne Arundel County Baltimore County Howard County Harford County Carroll County
2. Western Maryland:	Frederick County Washington County Allegany County Garrett County
3. Suburban Metropolitan Washington:	Montgomery County Prince George's County
4. Southern Maryland:	Charles County St. Mary's County Calvert County
5. The Eastern Shore:	Kent County Queen Anne's County Talbot County Caroline County Dorchester County Wicomico County Somerset County Worcester County
6. Northern Maryland:	Cecil County

Area

Maryland is not a large state, ranking 42nd out of 50 in terms of land area. Its 23 counties, plus Baltimore City, total 9,887 square miles of land area. Inland water area constitutes 703 square miles; the Chesapeake Bay consists of 1,726 square miles. The total land and water area is 12,303 square miles. Geographically, however, Maryland is in a strategic position in a rapidly developing urban complex between Boston and Washington, D.C. Due to an unusual configuration, Maryland also occupies a key position in numerous transportation routes.

It should be noted that Baltimore City is entirely separate from Baltimore County, both by government and by land mass. With the exception of Baltimore City, which is a compact 79 square miles, the other political sub-divisions are rather similar in size, with the largest counties being only three times the total area of the smallest counties and the average county size running approximately 450 square miles.

Climate

Maryland's climate has been described as moderate--more typical of the Northeastern United States than the South.

The elevation of the State of Maryland shows significant variation from section to section, generally varying from sea level at the coast to over 3,300 feet at Backbone Mountain in Garrett County. Differences in climate are more attributable to elevation, topography, and surrounding water bodies than to differences in latitude.

Population

Maryland State population has grown at a rapid rate in the past five years. In recent years, Maryland has been the fifth fastest growing state in the United States. Figure 1 shows that Maryland's growth during the 1960-1965 period fell only slightly behind that of California and Florida and slightly ahead of Delaware. The rate of growth for this period was substantially higher than the 8.5 percent average of all 50 states. Moreover, the 1966 population estimate of 3,632,140 suggests an intensifying growth rate. Figure 2 illustrates the acceleration of state population growth in recent years.

Individual county growth showed a considerable variation, with Prince George's County leading with a 57.3 percent increase. Howard County follows with a 37.7 percent increase between 1960 and 1966, and Anne Arundel, Harford, and Montgomery counties are not far behind at approximately 28.0 percent gain each.

The counties with greatest population increases are all situated in the Suburban Metropolitan Washington and Metropolitan Baltimore regions. The magnitude of these suburban population increases suggests that the Maryland experience is consistent with the urban population shifts characteristic of the nation. Baltimore City has virtually run out of land for additional housing and its population remains relatively constant (slight decline). However, with the exception of Baltimore City, the political sub-divisions with smaller than average growth were predominantly rural.

The demographic aspects of the population changes are rather revealing. The age groups are disaggregated into only three categories, under 18 years, 18 thru 64 years, and over 64 years. The youthful classification showed the largest increase, growing 17.7 percent from 1960 to 1965. The corresponding figure for the senior resident category, 13.9 percent, is slightly higher than the 12.5 percent increase for the 18 thru 64 year age group. This suggests that Maryland is experiencing burgeoning expansion of its youthful population and that greater longevity for the elderly is showing continued improvement. It is interesting to note, however, that these growth patterns are not reflected uniformly in all of the political sub-divisions. For example, the loss in Baltimore City population, 1.7 percent for the five-year period 1960-1965, is entirely within the 18 thru 64 year age group. This age group also experiences a decline in Somerset County. Although there is an increase in Baltimore's youth population, 4.0 percent, it is considerably lower than the corresponding rate of 13.3 percent for adjacent Baltimore County. The significance of these observations becomes more meaningful by relating them to the demographic characteristic of race.

Baltimore City contains the State's largest concentration of non-white citizens. The previously mentioned net loss in Baltimore City's 18 thru 64 year age category apparently reflects the effects of out migration of white families to the suburbs. The net population loss for the city was small because of a sizable increase in non-white population to almost offset the loss of white middle-aged people. In most other areas of the State both white and non-white population have grown simultaneously.

Industry and Employment

Industry and business have prospered in Maryland. Correspondingly, employment opportunities have grown. The major share of the growth in the 1960 to 1965 time period was in the non-manufacturing sectors. Non-manufacturing employment now generates over 65 percent of the total employment opportunities in the State. Manufacturing employment grew only slightly while agricultural employment declined almost 25 percent. There has been a significant expansion of government services in the area, which in turn has resulted in an increase in employment opportunities. Currently, the government sector provides over 25 percent of all jobs in Maryland. Figure 3 illustrates the employment picture by source in Maryland for 1960 and 1965.

Manufacturing - Manufacturing has not been the primary cause of real economic growth in the State of Maryland in recent years; rather it has been non-manufacturing services that have primarily contributed to Maryland's economic boom. However, Maryland has had a slight growth in the number of manufacturing establishments between 1958 and 1963. Maryland's position compares favorably with most other mid-Eastern states. New Jersey has had a much higher rate in the growth of number of firms, while Delaware and New Jersey have both had greater increases in value added by manufacturing. On the other hand, Maryland manufacturing has fared better than New York's, which has seen a drop in the number of firms and the number of employees in manufacturing during the same time period. Figure 4 illustrates the growth in manufacturing in Maryland and selected mid-Eastern states during this time period. Maryland's growth in number of manufacturing firms and manufacturing employment appears to be somewhat behind most of the southeastern states, especially Virginia, North Carolina, Tennessee, South Carolina and Georgia.

In the 1960 to 1965 time period, three industries stood out for their rapid growth in manufacturing employment. These are rubber and miscellaneous plastic products, printing and publishing, and machinery, excluding electrical, all of which had a greater than 20 percent increase in manufacturing employment. In the previous decade, 1950 to 1960, the largest Maryland growth occurred in the electrical machinery and pulp, paper and paper products industries. A notable difference between the 1950's and the 1960's is that rubber and miscellaneous plastic products have come forth to replace electrical machinery as the growth leader. Figure 5 illustrates the Maryland manufacturing employment picture by principal industries for the 1960 to 1965 time period. Consistent growth industries appear to include: printing and publishing; pulp, paper and paper products; stone, clay, and glass products; and machinery, excluding electrical.

Despite a rather stable manufacturing employment level, manufacturing payrolls increased significantly in the 1958 to 1963 time period. This can be principally attributed to increases in wages and salaries. Maryland's manufacturing payroll rose 23.5 percent during this time period, which is somewhat less than New Jersey and Delaware but more than Pennsylvania and New York.

The largest manufacturing payrolls in the State of Maryland are in the primary metals, the food and kindred products, and the transportation equipment industries. Chemicals and chemical products, printing and publications, along with machinery, except electrical, and apparel and related products trail significantly behind these three leaders. The primary metals industry has far and away the largest payroll and is almost double the second largest industry payroll of food and kindred products. Interestingly, apparel and related products is the third largest industrial classification in terms of numbers of employees but the seventh largest in terms of payroll due to substantially lower-than-average wage rates. Figure 6 illustrates the size of manufacturing payrolls in Maryland by principal industries for 1965.

The same three industries that dominate manufacturing payrolls also dominate value added by manufacturing industries in the State of Maryland. Primary metal products, transportation equipment, and food and kindred products are significantly ahead of other industries. Interestingly, transportation equipment has a relatively greater impact in value added than in manufacturing payrolls. This is probably due to the substantial professional payrolls of the aerospace industry. Value added data shows that electrical machinery and chemicals and related products have also made relatively larger contributions in value added. This may be due to the fact that these industries employ substantial professional payrolls. Figure 7 presents the value added by manufacturing industries in Maryland by principal industries for the time periods 1958 and 1963.

Non-Manufacturing - The non-manufacturing sector of the Maryland economy has been the main source of Maryland's dynamic growth in recent years. Principal elements of non-manufacturing employment are: government, wholesale and retail trade, general services, contract construction, finance, insurance, and real estate, as well as communications and public utilities. The largest non-manufacturing Maryland payrolls are government and wholesale and retail trade. Figure 8 illustrates the breakdown by classification of non-manufacturing payrolls in Maryland for the 1960 and 1964 time period.

Most categories of non-manufacturing employment have been seen and continue to see rapid growth in terms of employment (rather than payroll). The fastest growth has occurred in service and miscellaneous which includes business, health and personal services. Of all the non-manufacturing employment categories, only railroad transportation and agricultural employment has shown a decline in recent years.

Manufacturing and Non-Manufacturing Data By County - The total number of manufacturing firms has grown in recent years. Baltimore City has always been the dominant location of manufacturing firms in Maryland. Although the total number of firms has declined in Baltimore City, it still contains over 40 percent of all manufacturing firms in the State of Maryland. The other leaders, which are far behind, are Baltimore County, Prince George's County, Montgomery County, Washington County and Anne Arundel County. All, with the exception of Washington County, are located in the major metropolitan areas.

Baltimore City likewise dominates retail trade, having over 1/3 of all retail trade establishments in the State of Maryland and somewhat less than 1/3 of all retail sales.

To an even greater degree Baltimore City dominates Maryland wholesale trade, with more than 50 percent of the number of wholesale establishments and approximately 50 percent of all wholesale sales in the state.

Each Maryland county has its own dominant industries. Several counties have heavy employment in the Armed Forces, including Anne Arundel, Cecil, Harford, and St. Mary's counties. Others are notable for relatively large agricultural employment, such as Carroll County, Frederick County, and most of the Eastern Shore counties. Prince George's and Montgomery counties have particularly strong employment in public administration due to their proximity to Washington. Baltimore City is notable for its heavy employment in manufacturing and production industries.

Personal Income

Personal income gains were largely in the non-manufacturing sector. The largest increases took place in government civilian employment, where both federal and state and local payrolls grew substantially. Figure 9 shows the makeup of personal income in Maryland for 1965 in comparison with 1960.

During the same time period, personal income in Maryland grew faster than any of the states in the mid-Eastern region and in the Southeastern United States. Comparative personal income growth for the mid-Eastern states is illustrated in Figure 10. Of the Southeastern states, Virginia's and Georgia's rate almost equaled Maryland at just under 45 percent each for the same time period. In per capita personal income growth for the same time period, Maryland's rate fell slightly below a number of the Southeastern states including Virginia, North Carolina, South Carolina, Georgia, Kentucky, and Tennessee. In average per household disposable income, Maryland ranks only behind Delaware of the mid-East and Southeastern states. Household disposable income is highest in the metropolitan areas. Suburban Washington's disposable income leads with Montgomery County having the highest average disposable income of any county in the United States. Anne Arundel, Howard and Baltimore counties are close behind at almost \$10,000 per household per year.

Agriculture

Maryland, like most other areas of the United States and particularly the "megalopolis" states, has been undergoing a shift from rural agricultural living and employment to urban manufacturing and service employment. The land devoted to farming and the number of farms have been declining steadily. Figure 11 illustrates the decline in the number of farms by size for 1964 relative to 1959. All size farms, except the very largest (e.g. 500 acres or more), have declined. It appears that the future lies mainly in the highly-organized and highly-mechanized farming operations.

The value of farm products sold continues to increase due both to increases in actual production as well as a slight price increase. The average value of product per farm increased 44.4 percent between 1959 and 1964. Only livestock products other than poultry and poultry products declined in terms of value of output during this period. Figure 12 illustrates the breakdown of farm product sales for 1959 and 1964 in the State of Maryland.

Despite the movement towards larger farms, the number of farms in Maryland grossing \$10,000 or more per year actually showed a small decrease in the 1959 to 1964 time period. At the same time, there was a slight increase in the number of marginal farms grossing less than \$2,500 per year. This is illustrated in Figure 13.

Although the total number of commercial farms in the State decreased in recent years, there has been some increase in the farms specializing in field crops and also vegetable farms. The largest decrease has been in the number of poultry farms, dairy farms, other livestock farms. Since poultry and poultry products have shown a substantial increase in value during the same time period, the decline in the number of poultry farms is mainly attributable to consolidation and larger scale operations. Figure 14 illustrates the number of commercial farms by type for 1959 and 1964.

The largest sources of farm income are livestock products, which account for more than 2/3 of the value of all agricultural commodities. In Maryland the dominance of this category is principally due to dairy products and poultry. Cattle and calves, eggs and hogs are important, but substantially smaller elements. Field crops account for approximately 20 percent and are led by tobacco, corn and soy beans, while vegetables and melons, as well as greenhouse and nursery products, are also important sources of farm income in the State of Maryland. Figure 15 illustrates the principal sources of farm income by major commodities in 1964.

Recreation and Tourism

With the rapid rise in leisure time, there has been a corresponding increase in recreation and tourism facilities and activity. Much of this growth has taken place since 1950 and in recent years continued, but began to take on some different patterns. Most notable is the increase in sport hunting and fishing activities, where in the five years between 1960 and 1965 there has been an increase of almost 40 percent in the number of hunting licenses in Maryland and an increase of 25 percent in the number of fresh water fishing licenses. Studies have claimed that sport fishermen in Maryland catch from two to four times as many fish as does the commercial fishing industry. Maryland's multitude of water recreation areas are increasingly used by sportsmen for fishing, hunting and other pleasure activities.

Maryland's State parks are striving to keep pace with the demand for leisure activities by adding new land and especially new facilities to improve the utilization of their State parks and forests. In the 1960 to 1965 time period, there was an increase of more than 10 percent in the land area for State parks and forests. Recorded attendance has also shown a slight increase.

Tourism and business travel in the State are believed to be increasing rapidly. Because Maryland, by its geographical location, is a state which many people must pass through to get to such attractions as the Nation's Capitol, New York City and the seashores, tourism is a significant (but difficult to estimate) factor in the Maryland economy. Further, the new national park on Assateague Island should contribute to a major increase in tourism.

Contrary to increased travel trends, the number of hotels and motels and other tourist facilities has declined slightly in the 1958 to 1963 time period. This is probably mainly attributable to the fact that small obsolete units are being eliminated and replaced by larger, more modern facilities.

Construction

Maryland has been seeing a rapid growth in new construction since World War II. Maryland's total construction average per year is running at 2.4 percent of the total United States construction, which is substantially greater than its population and personal income as a percentage of United States totals. Construction, therefore, is a major indicator of Maryland's healthy economic growth. The most remarkable growth in Maryland construction has occurred in commercial, residential and non-residential construction, which in 1965 accounted for approximately 75 percent of the total value of construction.

Transportation

The major boom in transportation across the country in recent years has been the personal automobile. Maryland is no exception, and this is accompanied by similar growth in highway mileage, automobile ownership, and average daily vehicle miles. The traffic volume at state toll bridges and tunnels is up appreciably and in some cases utilization is approaching capacity and new facilities are planned or under construction.

Maryland has substantial waterfront areas, both on the Atlantic Ocean and most especially the Chesapeake Bay. The Port of Baltimore is a well-equipped deepwater port that ranks among the nation's leaders. There are also a number of smaller waterways which account for approximately 3 percent of Maryland's waterborne commerce, while the Port of Baltimore accounts for 97 percent of the state's waterborne commerce.

The Port of Baltimore's activity in the past ten years appears to have been relatively stable. The number of vessel arrivals in 1964 is approximately equal to 1955. The value of shipments has increased; however, the number of passengers and the tonnage handled have declined slightly.

Baltimore ranks as the third largest foreign trade port in the United States in terms of total tonnage (exports plus imports). Baltimore is chiefly a bulk shipment rather than general cargo port, which is primarily routed through New York. Only Philadelphia and New York rank ahead of Baltimore in

total tonnage handled for foreign shipments; however, Norfolk, Newport News, New Orleans and Houston rank ahead of Baltimore in exports. Baltimore's tonnage is largely due to imports which account for approximately 3/4 of the tonnage handled.

The major commodities handled by the Port of Baltimore are machinery and transport equipment, miscellaneous manufactured articles, crude materials, inedibles except fuels, and food and live animals. Although the import tonnage is substantially greater than the export, the value of exports is almost equivalent to the value of imports. This rough equality is due to the fact that exports are predominantly sophisticated machinery and devices, where imports are principally bulk commodities and raw materials.

The Port of Baltimore also handles substantial quantities of coast-wise United States shipping, principally petroleum products. Internal and local commerce is largely made up of shipments of bituminous coal and lignite.

The principal countries of lading on foreign shipments are Venezuela, Canada, Liberia, and Chile in terms of tonnage; while West Germany and the United Kingdom, along with Peru and the Republic of South Africa, dominate in terms of dollar value. European countries have a clear lead in terms of value of foreign commerce, whereas South American countries are predominant in terms of tonnage of trade.

The major growth in modern travel has been in the utilization of the airplane. Baltimore's Friendship International Airport activity reflects this rapid growth. The time period 1960 to 1965 shows the total number of passengers handled increased 140 percent. The amount of freight increased 201 percent for the same time period. The number of small planes in usage has also been increasing at a rapid rate and Maryland now has a large number of commercial airports that can be found in practically every county of the State.

Utilities

The need for energy has been increasing at a fantastic rate. Installed electrical generating capacity in Maryland has increased over 65 percent in the five years between 1959 and 1964. The largest share of this is due to electrical utilities. Maryland now has nuclear powered electric plants and plans have been made to build more nuclear plants in the future. The ownership of electrical utilities lies mostly in private hands, with over 76 percent privately owned. A similar demand for gas utility energy has taken place in the same time period. The number of customers has increased only 14.6 percent between 1959 and 1964; however, the total revenues have increased 40 percent during that time period, indicating an increase in the per customer usage of gas.

The telephone also continues to play an increasingly dominant role in business and personal communication. There are more than one million telephone accounts in the State of Maryland with over 1.8 million telephones. It is likely that future years will see continued expansion in the use of telephones, particularly for data processing and retailing, improved international communications via satellite, and the advent of the telephone-television combination.

Natural Resources

Forty-three percent of Maryland's total land area is classified as forest land. Although this is somewhat less than Pennsylvania's and Virginia's proportion, it is greater than Delaware's and greater than the national average of 33 percent of all land area. A major share of this forest land is termed commercial forest land which includes all privately owned and also public park land. The forest land is largely (91 percent) in private hands with approximately 8 percent of all forest land in the State being publicly owned.

Over 75 percent of the State's timber is classified as hardwood and the State Board of Natural Resources estimates that 188 million board feet of lumber are cut per year by the State's 192 sawmills. The forest land of Maryland and its timber are threatened annually by forest fires. The number of forest fires has increased substantially in the past five years with 652 accounted for in 1965, which burned a total area of over 2,600 acres.

Mineral products in the State of Maryland were valued at almost \$74 million in 1964. Accounting for almost 90 percent of this total were stone, cement, lime, and sand and gravel.

Due to Maryland's location on both the Atlantic Ocean and the huge Chesapeake Bay which touches many of the State's counties, seafood is an important Maryland resource. Since the sport fishing harvest is substantially greater than that of commercial fishermen, the data in the tables greatly understates the annual catch. The Department of Interior reports that the Maryland fish catch in 1965 totaled over \$13 million. The largest share of this was in oyster and shellfish, particularly oysters, crabs and clams. It is estimated that there are more than 9,000 fishermen in the State with over 6,000 boats and 63,000 crab pots. The leading fish catch in value are striped bass (rock) and white perch.

Education

As in every other area of the country, education has received a great deal of attention in recent years. The number of children entering elementary school is at an all time high, not only due to the population increases, but also due to the very high rate of child birth in the late 1950's. The number of schools in Maryland has increased by almost 18 percent in the past ten years. The number of teachers has increased still more--approximately 75 percent in the same time period. While the number of pupils has increased slightly less than 60 percent during this period, the Maryland State Department of Education reports that in 1965 there were 730,000 pupils in Maryland public schools. This was a 25 percent increase over 1960 enrollment. The Department of Education also reports that the cost per pupil has almost doubled in the past ten years and in 1964 was \$437 per pupil. The average annual salary to teachers has been one element of added cost and has increased 50 percent during the same time period. Significantly, during this same time period, the number of students per teacher had decreased from 26.8 to 23.3 percent.

Maryland high school graduates in 1964 numbered over 34,000, an increase of 126 percent over 1955. Each year a greater proportion of Maryland high school graduates go on to college. Over 35 percent of Maryland high school graduates in 1963 continued into higher education.

Enrollment in Maryland higher education institutions has reflected the strong trend toward more higher education. An estimated 7,850 full-time day students in 1966 were enrolled in Maryland's 18 two-year colleges. Including evening and part-time students, the two-year colleges had 15,628 students in 1966. The State has 29 four-year colleges and universities with a full-time day student enrollment of over 45,000. More than 25,000 part-time students, plus 12,000 graduate students, bring the total enrollment in 1966 to over 82,000 students. All total, 31,000 college students were enrolled on a part-time basis, plus 63,000 on a full-time basis, for a total of almost 100,000 college students enrolled in Maryland higher education institutions.

The largest higher education institution in the State is the University of Maryland with a total student enrollment of over 38,000 representing almost 40 percent of the State's higher education enrollment.

State Finance

Maryland's 1965 State expenditures totaled \$721,577,000. Of this total, 30 percent went towards education, 22 percent towards highways, and 9 percent towards health, hospitals and mental hygiene. Ten percent went to public welfare. In the same time period, the State of Maryland took in \$724,890,000 of which 23 percent came from income tax, 15.7 percent from retail sales taxes, 11 percent from gasoline, 9 percent from motor vehicle registration, 14.7 percent from federal grants, and 6.7 percent from bond issues. The expenditures have increased approximately 58.0 percent over 1960, while revenues have increased at the same rate.

Banking

The number of active banks in the State decreased by 20 percent between 1960 and 1965. This is largely attributable to a number of bank mergers, particularly small banks that were made branches of larger institutions. The total assets or liabilities also decreased slightly by 7 percent. The major change occurred in State commercial banks rather than national banks. The number of State banks dropped from 83 to 56 during that time period. During the same period, industrial finance companies increased by 36 percent (257 to 350) and their total assets or liabilities rose 95 percent to \$258 million. The number of credit unions decreased 10 percent from 43 to 39 during the same time period. Their total assets or liabilities are \$36 million.

U. S. Government Property

The United States Government owns and leases substantial land area and buildings in the State of Maryland. The size of federal operations is at least partly due to the proximity of Maryland to Washington, D.C.

In 1965 the federal government owned over 185,000 acres and leased an additional 3,000 acres of property. In addition, they owned 11,926 buildings and leased an additional 684 buildings. Federal government properties in Maryland have shown rather substantial increases in recent years.

Science-Industry Complex

Maryland is one of five dominant science centers in the United States and is probably the fastest growing research and development center in the nation. Part of this dominance may be attributed to Maryland's location. The Free State surrounds the Nation's Capitol which is also recognized as the science center of the world.

However, there are other factors besides proximity to the Nation's Capitol which makes Maryland an attractive place for science industry. The most important of these is its educational institutions. Heading these are the University of Maryland, located in the Washington Metropolitan Area, and the Johns Hopkins University in the Baltimore Metropolitan Area. In the nearby District of Columbia are the American University, Catholic University, George Washington University, Georgetown University, and Howard University, which, together with the former two, provide excellent educational opportunities in science and engineering (both degree programs and continuing education) for the full-time employee.

For undergraduates, in addition to the two universities, there are 27 4-year colleges and 18 2-year colleges in Maryland which provide higher education, both public and private, at campuses within commuting distance from almost all communities throughout the state.

Other factors are excellent transportation facilities by air, land and sea to people and markets all over the world; a highly diversified industrial complex to provide supporting services for science industry; modern zoning regulations to provide campus-type industrial sites; and excellent housing, cultural and recreational facilities within easy driving distance of each other and places of business.

It is often said that like things attract like things. The current Directory of Science Resources for Maryland lists 37 federal R&D installations in Maryland. Many of these are large nationally-known laboratories -- National Institutes of Health which employs 11,623 persons, of whom 2,992 are scientists; Agricultural Research Center with 2,800 employees, of whom 1,250 are scientists; Atomic Energy Commission Headquarters; NASA's Goddard Space Flight Center; and many important laboratories of the Army, Navy and Air Force.

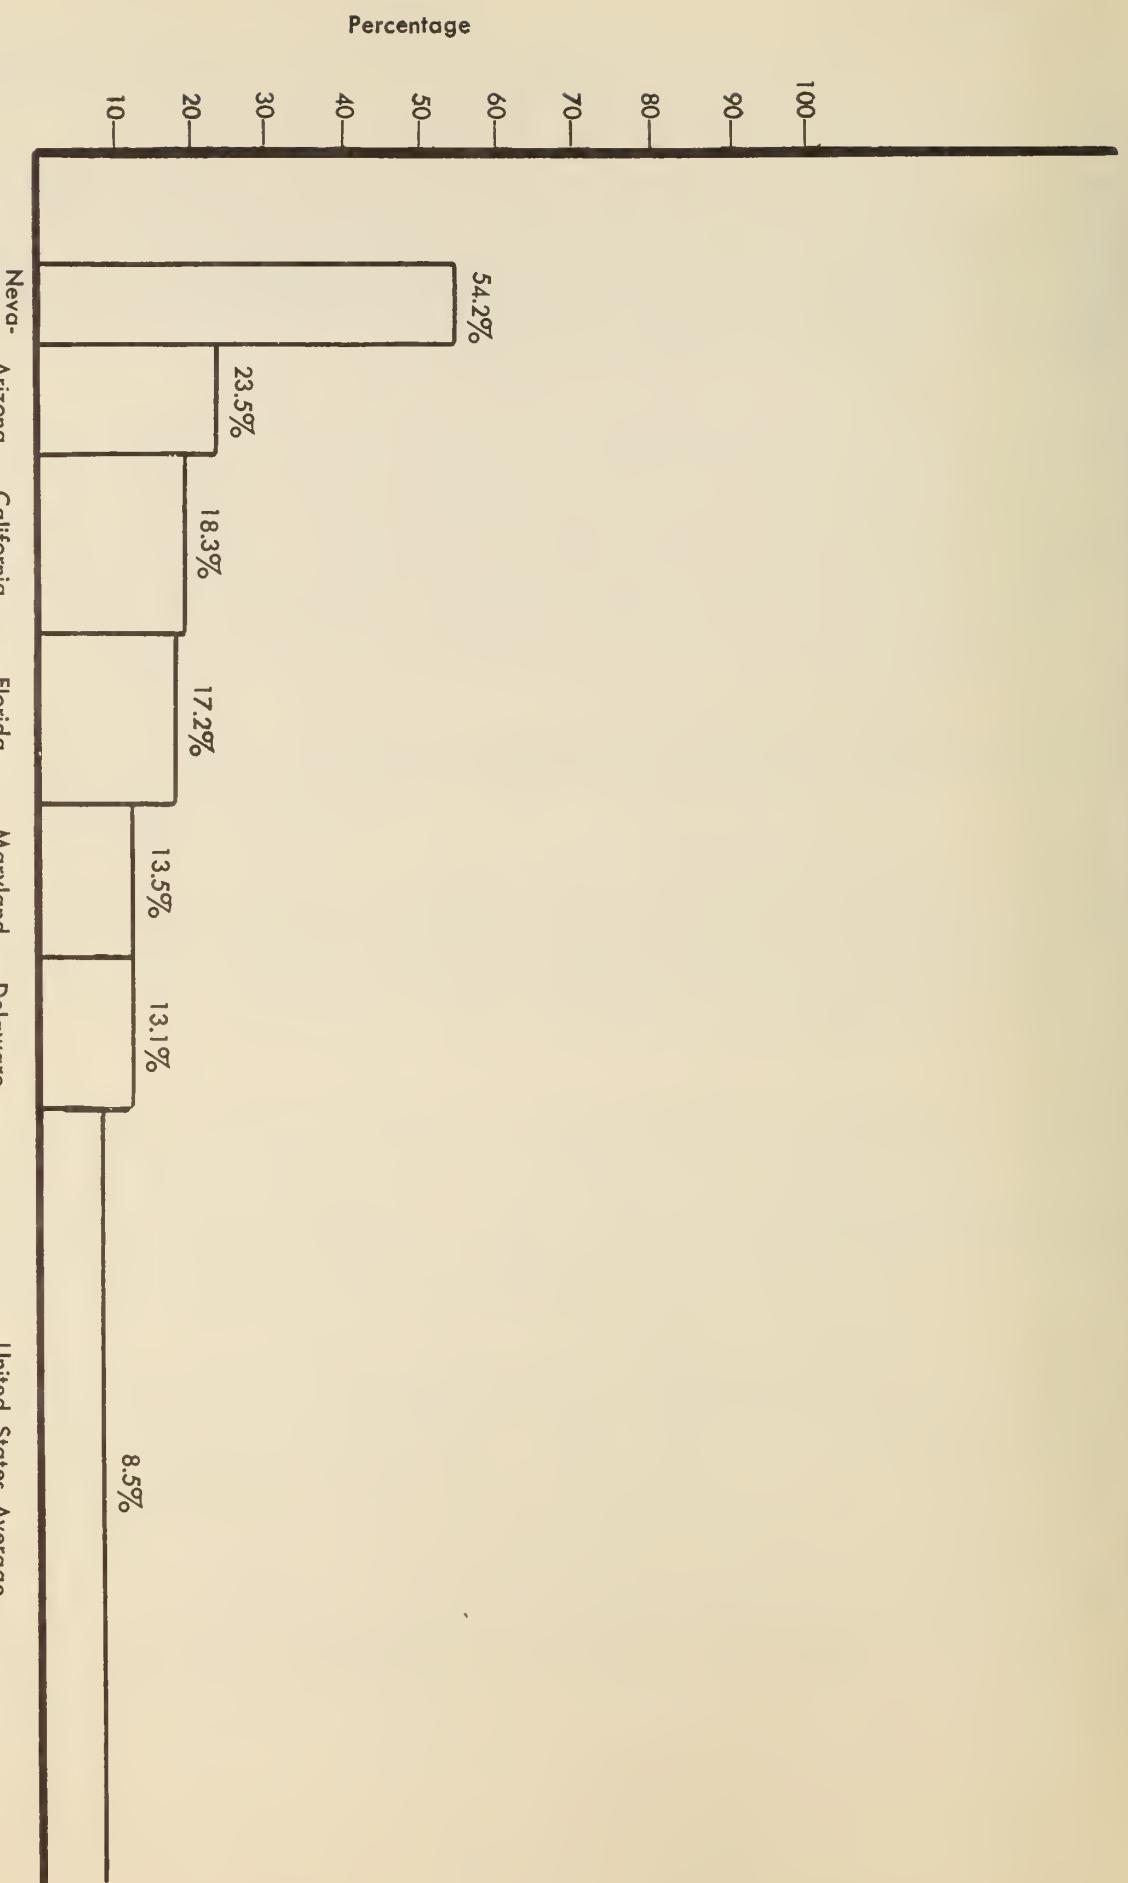

More important is the 363 R&D firms listed in this directory. Their total employment is 79,809 persons, of whom 16,758 are professionals, 43 of these firms located in Maryland during 1964 and 1965. Evidence of the dynamic growth of this science complex is the fact that, during this same two-year period, 35 of the 323 firms previously listed showed a 50% or more increase in employment.

The total federal R&D obligations for FY 1965, in Maryland, were \$876.6 million or 6.1% of the national total of \$14,356.8 million. This placed Maryland in third position following California and New York, among the 50 states. The accompanying table gives a breakdown of this figure by performer and by the federal agencies providing the funds.

Conclusions

The record of growth and prosperity for Maryland is indeed impressive. The future promises to hold further opportunity, but also raises the challenge of making wise decisions and choices. Review of the data presented in this report helps to identify some of the needs for better information to guide decision makers. More disaggregated data by county--precise locale, race, age, etc.--are obvious needs. Also needed is more information on employment, unemployment, training, land use, construction, research and development, health and welfare, educational achievement, housing, new plant and equipment, and migration. Maryland, if it is to remain a leading state in terms of economic growth, will continue to develop improved information.
